AMENDMENTS TO THE CLAIMS

1. - 17.(Cancelled)

18. (Previously Presented) A method for treating inflammatory diseases which comprises

administering an effective amount of a reducing-sugar monomer of rhamnose or fucose, whose

hydroxyl function is substituted by an C<sub>2</sub>-C<sub>40</sub> alkoxy radical, as an active agent, to a patient in

need thereof.

19. (Previously presented) The method according to claim 18, wherein, in the reducing-

sugar monomer, the substituted hydroxyl function is the anomeric hydroxyl function.

20. (Previously presented) The method according to claim 18, wherein the alkoxy radical

comprises from 5 to 12 carbon atoms.

21.-22 (Cancelled)

23. (Previously presented) The method according to claim 18, wherein the inflammatory

disease is selected from the group consisting of allergic, inflammatory or immune reactions and

pathologies of the skin and/or mucous membranes.

24. (Previously presented) The method according to claim 18, wherein the inflammatory

disease is due to an immune response related to inflammatory stress.

25. (Previously presented) The method according to claim 18, wherein the inflammatory

diseases is related to the activation of leucocytes, the secretion of keratinocytic cytokines, the

keratinocytic hyperplasia phenomenon, antigen processing by the dendritic cells of the skin, the

maturation of antigen-presenting cells and the recognition phenomenon between lymphocytes

and antigen-presenting cells.

26. (Previously presented) The method according to claim 18, wherein the inflammatory

disease is selected from the group consisting of atopic and/or contact eczema, inflammatory

dermatoses, irritant dermatitis, acne, autoimmune diseases such as psoriasis, photo-

immunosuppression, vitiligo, pityriasis, sclerodermas, rheumatoid arthritis, Crohn's disease and

graft rejection.

27. (Previously Presented) A method for treating age-related chronic inflammatory

problems and their consequences which comprises administering an effective amount of a

reducing-sugar monomer of rhamnose or fucose, whose hydroxyl function is substituted by an

 $C_2$ - $C_{40}$  alkoxy radical, as an active agent, to a patient in need thereof.

28. (Previously presented) The method according to claim 27, wherein the age-related

chronic inflammatory problem is chosen from the group comprised of anaphylactic sensitivities,

pigmentary anomalies of the skin, dermal hypervascularity and inflammatory fissuring.

29. (Previously Presented) A method for reducing the allergenic and/or irritant character

of a composition or perfume which comprises administering an effective amount of a reducing-

sugar monomer of rhamnose or fucose, whose hydroxyl function is substituted by an C<sub>2</sub>-C<sub>40</sub>

alkoxy radical, to a patient in need thereof.

30. (Previously presented) The method according to claim 18, wherein the medicament

contains from 0.001% to 50% by weight of the aforementioned reducing-sugar monomer.

31 - 36. (Canceled)

37. (Previously presented) The method according to claim 27, wherein the medicament

contains from 0.001% to 50% by weight of the aforementioned reducing-sugar monomer.

38. (Previously presented) The method according to claim 29, wherein the medicament

contains from 0.001% to 50% by weight of the aforementioned reducing-sugar monomer.

39-40. (Canceled)

41. (Currently Amended) The A cosmetic treatment method according to claim 35, to slow the accelerated aging of skin which is caused by wherein the accelerated aging of the skin is photo-induced aging wherein it consists of applying to the skin a composition comprised of at least one reducing-sugar monomer of rhamnose or fucose whose hydroxyl function, is substituted by an alkoxy radical at C<sub>2</sub>-C<sub>40</sub>, as an active agent.
